1.

a) Hydrosphere :-

It is a natural Resources which helps to grow the crops and human use. hydrosphere is a water. Water plays a very important role in the Agriculture field. and it is very much useful in the growing of plants. In the Earth's Surface we can see 75% of water. Like lakes, rivers, ponds, Oceans etc.

(b) Metamorphic Rocks.

Metamorphic Rock it is a Rock which is breaking down of Rocks and it is a igneous and Sedimentary Rock both break down and then Metamorphic Rocks breaks.
for example :- Quartz.

d) Soil temperature :-

Soil temperature varies according to the temperature
Some times cold, hot temperature it varies from
One place to another place.

(f) Organic Manure:-

Organic Manure :- It is a natural substance
which gives nutrient sufficiently to the plants
It is a natural substance like cowdung, cow
urine it plays a virtual role soil and in
Agriculture land. Organic Manure Makes the
soil fertile.

for Example :- Farmyard, Compost, Cowdung,
Cow urine.

PART :- "B"

2. The Characteristics of Atmosphere:-

Atmosphere:- It is a natural Resource that is Atmosphere means Oxygen, Nitrogen, Carbon dioxide. For all these makes a Air. Soil, water, Minerals and Organic matter combines to form a atmosphere. Atmosphere plays a virtual role in the supplying Oxygen to the human being and living Organisms. For plants it supplies Carbon dioxide. Atmosphere plays a virtual role supplying air to the soil. For supplying the air the plants are growing.

The Characteristics of hydrosphere:-

hydrosphere:- It is a natural resource that it is in the Earth 75% of the Earth containing water bodies.

hydrosphere formation on the Earth is billion years year it helps the living Organisms. Hydrosphere formation on the Earth is by clouds and the dust it forms.

In the Agricultural purpose it helps for growing plants. hydrosphere it is on the Earth as well as in the planets. hydrospheres covers 75% of the land. like ponds, lakes, rivers, Oceans.

The Characteristics of "lithosphere"

Lithosphere it is a natural substance present on the top of the soil of the Earth surface.

Lithosphere plays a important role in Agriculture field and in the soil and growing crops.

Lithosphere came in y. very far years ago.

Lithosphere contains Minerals, Oxygen, Nitrogen

& phosphorus. it is an Organic Matter. it is

Solid like substance. about 45% of lithosphere

we can see on the Earth. It is hard in

structure. Lithosphere plays a important role in

water holding capacity. It having very

much water holding capacity. It is solid

like structure.

3. The role of Minerals Matter and Organic Matter in Soil formation:-

The role of Minerals in the Minerals Matter it contains more Minerals like Oxygen, Nitrogen, Magnesium Sulphate and Many Other Minerals that found in the Matter. Matters means Solid, liquid, and Gaseous. In the Minerals Matter by breaking down of the rocks. So many Minerals are found. By breaking down of the Minerals like Big Rocks the Soil was formed. and the Rock breaks down by physical, chemical and biological weathering it breaks down the rocks. by doing these Soil formation happens. Minerals are essential for growing crops and plants. And for this we all are having efficient nutrient. The role of Minerals to have a good and health nutrient providing for the Soil and in Agriculture land.

The role of Organic Matter in Soil formation.

The Organic Matter plays a important role in the Soil formation. Organic matter like water, Air, Oxygen and many other Organic matter

Green manure, cow dung, cow urine, Farmyard and Vermicompost, Compost these all are

Organic Fertilizers these all are play very important role in soil formation and soil fertility and the soil nutrient management.

Organic Matter it plays very important role in the formation of soil. Soil is the very much important in the Agriculture field. Soil in the Agriculture field it gives Nutrients.

5. The importance of Soil water and its role in plant Growth.

Soil water: In the Agriculture field the water and soil are very important for growing crops & plants. water plays a essential role in supplying nutrients to the soil. and soil supplies a Nutrient to the plants these was the importance of soil and water in the Agriculture field. Soil contains many Minerals like Oxygen, Carbon dioxide, Nitrogen & phosphorus and many other Nutrients.

In the plant growth its role play a virtual role. For soil and water they both are essential in the water and soil in Agriculture land. Water makes the soil very much nutritionalable. and soil holds the water and in that water all the nutrients are supplied and in the soil they holds nutrients and Minerals they all supplied to the plant growth. Both soil and water plays a virtual role in growing plants.

The dead and decaying animals and plants that also give a Minerals and Organic matter to the soil. this helps to grow grow the plants nutritionalable.

And water should be more good quality and improve the growth of Nutrition in the crops and Check the Salinity of the water.

To checking water salinity and alkalinity better to grow the crops and manage a nutritionalable crops.

PART:- "C"

8. The different types of weathering process contribute to soil formation in varied climatic conditions.

The weathering is a natural processing that the weathering contains three types that are

- 1) Physical weathering
- 2) Chemical weathering
- 3) Biological weathering

Physical weathering.

Physical weathering It is a process of a breaking down of a rocks into smaller pieces.

Physical weathering is also a forms Chemical and the Mechanical both the states. By breaking down of the rocks it forms a Soil.

The climatic varied in the hot or Summer Season the Rocks will get very hot at that time the Rocks will expand the Rock and

In the winter or Rainy Seasons the Rocks becomes Contract and small in size

This Contracting and expanding the Rock will becomes loose and they breakdown

the Rocks for breaking down of the rocks by physical weathering. This is called a physical weather varied with a climatic conditions.

Chemical weathering:-

Chemical weathering it is a process in which the break-down of the Rocks in the smaller pieces by the helps of chemical and climatic supports.

The Breaking down of the chemical and The heat and cold formation varied with the chemical and forms a soil. Chemical weathering involves both chemical and mechanical. Chemical

weathering is a process of breaking down of the Rocks and the Big and Big rocks are breaking down by the help of chemical weathering and chemical weathering also varied with a climatic zones conditions. Chemical weathering also Big expands the Rocks and contract the rocks in some times by doing this fixation the the rock will slowly broken down. and forms a soil.

Biological Weathering:-

Biological weathering is a process of breaking down of the rocks into smaller particles and forms a soil. It also varies with the climatic conditions like summer, raining and great winter. For living and non-living organisms, the biological weathering includes the dead and decaying animals, this all are also come under the biological weathering. And by the biological weathering, the rocks will be cut down by the smaller pieces. This biological activity makes a rock more erodable and it is a biological weathering. It is cut down with a climatic conditions. By the dead and decaying living organisms, the biological weathering is happening.

10. The Significance of beneficial Soil Organisms in Improving Soil fertility and Sustaining Agriculture in India.

The Significance of beneficial Soil Organisms like Earthworm, Fungi, living bacteria this all come under the Soil MicroOrganisms these all the MicroOrganisms improves Soil Fertility by the Organic matter by these Soil become more fertile as Soil holding water capacity. The MicroOrganisms Fungi, bacteria, living bacteria provides more sufficient nutrients to the Soil and makes the Soil Nutritionable and growing Crops to the various seasons the best thing is Earthworms makes the Agriculture field more and more fertile. The makes a Sustainable Agriculture land.

By the MicroOrganisms the Agricultural field came in the first in cultivating the Crops in the Nutritionable and makes the Crops and plants Nutritionable. By the Organic fertilizers like Compost, Cowurine it gives sufficient Nutrition to the Soil and by Gause sufficient Nutrition the Soil become more

Fertile. and it May use again and Again for Crop cultivation purpose.

The Soil Organisms improve Soil by various Organisms that are Fungi, Earthworms and living bacteria, For all the Organisms having high power to make Soil more Fertile and the these all the living Organisms makes the Soil more Fertile which helps to grow a Crops perfectly.

The Soil Organisms is beneficial for Growing a Crops. and the Soil Organisms plays a important Role in the growing plant and living Organisms p. make the Soil more profitable and in the living Organisms plays a important role in the forming Soil fertile by Minerals matter like Oxygen, phosphorus, Nitrogen by all these Soil becomes more Fertile. And the water also plays a important role in the Agriculture field that is the it gives the strength to upstand the plants. and by Fertilizers and Organic Fertilizers improve Soil Fertility and makes Sustaining agricultur in India.

The soil Organisms is beneficial Soil Organisms in improving soil Fertility and Sustaining Agriculture in India.

11. A Farmer wants to grow wheat and rice using Combination of Organic and Chemical Fertilizers.

By the Both Organic and Inorganic Fertilizers help the Farmer can grow the wheat and rice for the Rice the Organic Fertilizers like cow dung, cow urine and Vermicompost and Compost Green Manure these all are the Organic Fertilizers that can be supplied to wheat and rice that gives Nutrient in a higher Content and it is a very much Nutritious and it takes time and makes a Nutritious And it supplies Naturally. By these water capacity also main in these By doing a making a Natural Organic Fertilizers which leads to drink more water to the soil and that water quality must be good and alkalinity is also good for these Organic Fertilizers helps in the growing the crops more Nutritious. The Organic matter like cow dung, cow urine and many other Fertilizers performs an important role in the

growing crops. and it sustaining Agriculture in India.

In supplying inorganic Fertilizers like N, P, K Nitrogen, phosphorus, Potassium are very much useful in the growing crops.

In Organic Fertilizers these all are the man made Fertilizers that includes ~~see~~ potash, phosphorus and many other Fertilizers and it gave a Nutrient to the growing crops and it is also having Minerals and Organic matter and Minerals matter that it contains more Nutrition to the plant growth and it is sustaining agriculture in India.

For Examples Rhizobium, Azorobacteria.

By these Organic and inorganic Fertilizers they have both Organic and inorganic having both Nutritional Factors that plays a important role in the growing crops. and Managing plans includes Fertilizers and both have water holding capacity and supply a Minerals and Nutrients to the crops.

The Nutrient Management plan including types of Fertilizers.

That are:-

1) Straight Fertilizers

2) Mixed Fertilizers

1) Straight Fertilizers

- Straight Fertilizers plays a important role in the growing crops.
- It supplies a only one primary Nutrient.
for example N → Nitrogen,
K → potassium

2) Mixed Fertilizers.

- > It supplies both primary and secondary Nutrients to the crops

for example:- DAP,
MOP
N, P, K

These all are the fixe Fertilizers Examples there all are plays a important role in the growing a Nutritionable Crops.

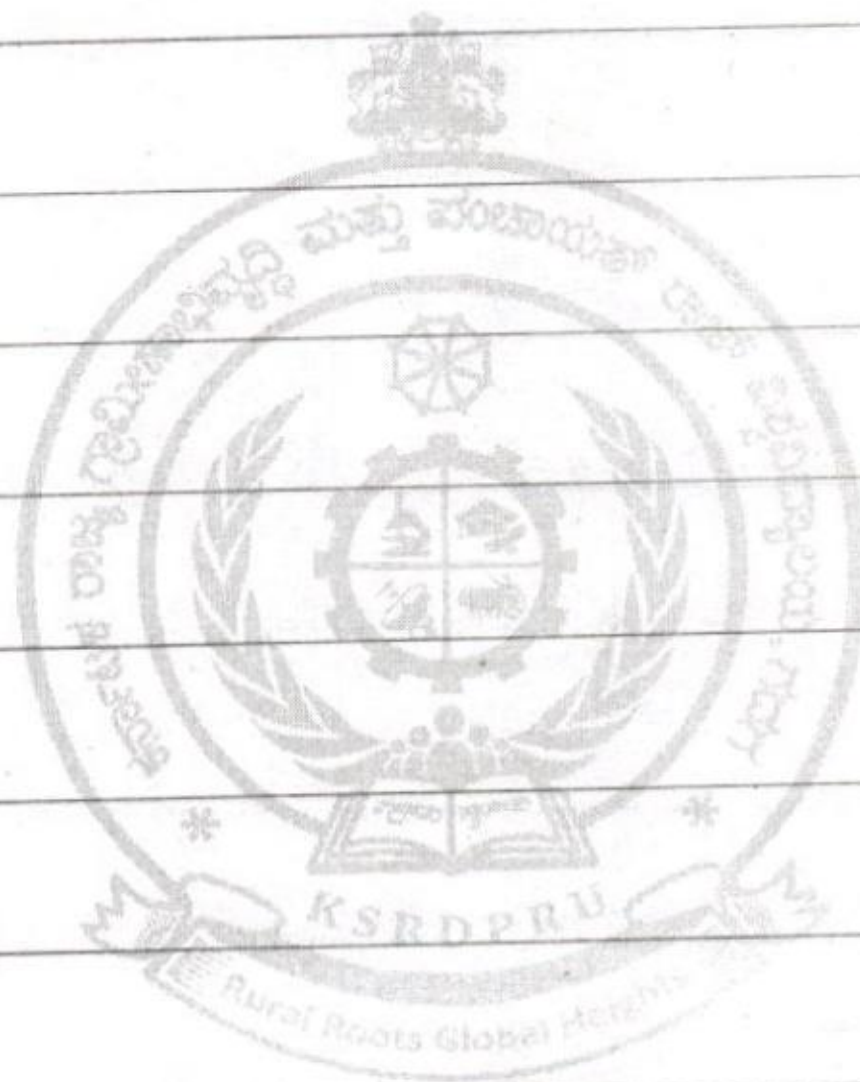

Water quality:- The growing crops including good quality of water and makes the agricultural land and soil more fertile and makes the water quality very good then the crops will grow a nutritious growth. But the water quality and salinity must be good. Don't in the form of salt, it is not sufficient for the plant growth.

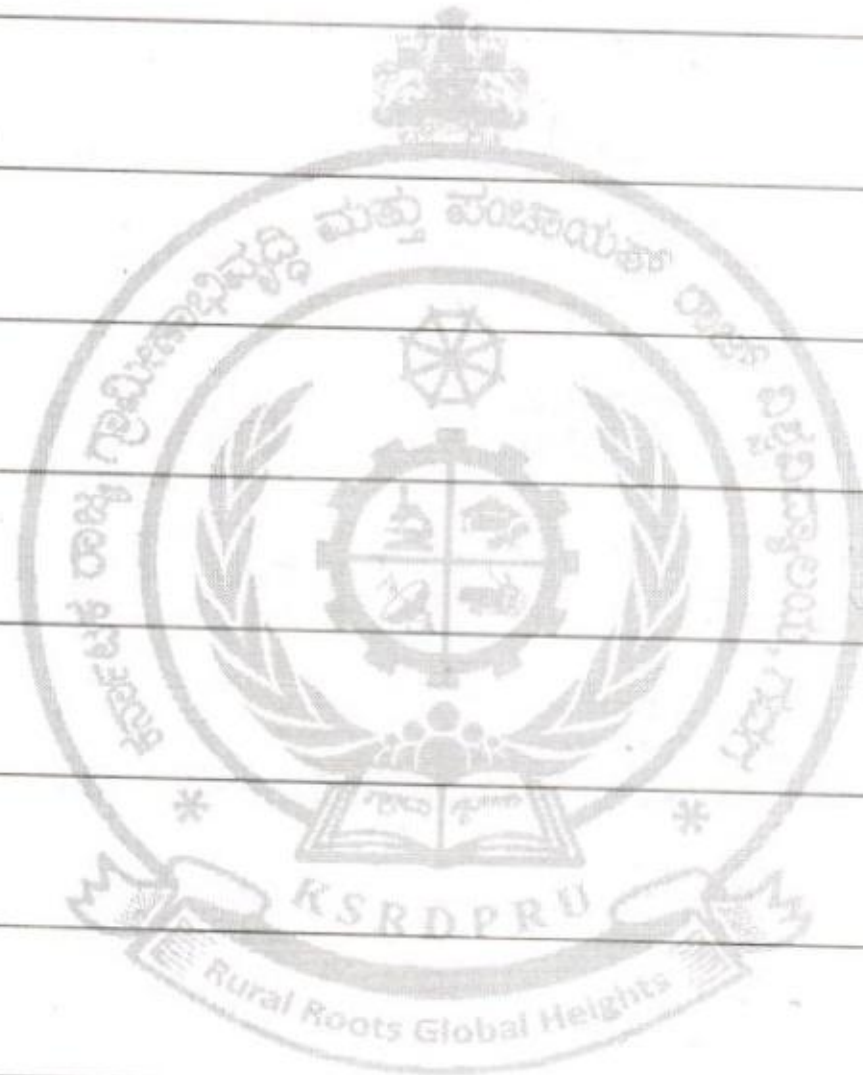

And it does not hold sufficient water. For crops main purpose is to hold the water capacity correctly and transform the water to the crops and make the crops more nutritious.

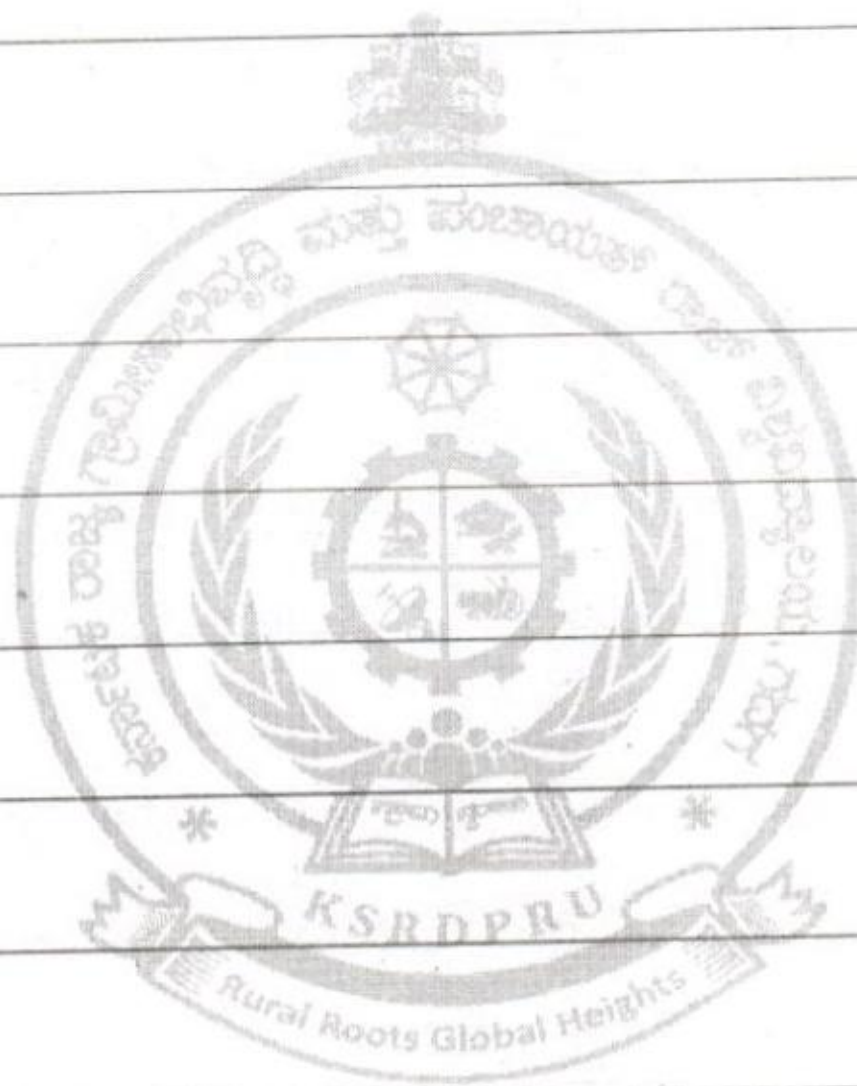

The farmers want to grow a wheat and rice using combination of organic and chemical fertilizers by nutrient management plan including fertilizers and water quality.
