PART - A.

d) Health is being State of Physically, mentally, Socially well being and not merely absence of any disease, and role of Public health is Preventing disease, prolonging life, Promoting Health through the organized efforts of a Society.

e) 4 non communicable disease

- ① ~~hypertension~~ hypertension
- ② Diabetes
- ③ Cardiovascular disease
- ④ Cancer

f) Spectrum of health.

Positive health.
mental health
Freedom from sickness
unrecognized sickness
mild fever sickness
severe fever sickness
Death.

PART - C.

8) Determinants of health.

Determinants of health means which influence the Health with various factors like Biological factor, environment and social, lifestyle and many.

→ factors are

- a) Biological factor
- b) environmental factor
- c) social factor
- d) behavioural factor
- e) Health care services

a) Biological factor.

Biological factor which from cell, tissue and organs of the body.

→ Genetic

The diseases occur from the genetic for ex:- when our parents are suffering from a disease like diabetes and hypertension and there is chance that we may suffer from the disease in future.

ex:- diabetes & hypertension.

→ AGE

when we are getting older then occurrence of diseases are also higher it may be of having less immunity power and other reason as well.

ex: when the women got pregnant over 35 age then it should consider as high risk pregnancy.

• old age people are suffers from the ortho related problems.

→ SEX

The disease are occur in specific age male and female as well.

ex: breast cancer.

b) Environmental factor

→ Physical environment - In Physical environment different types of pollution like Air, water, sound and changes in the climate.

ex: ① from drinking of contaminated water. there is a chance of having colera disease.

② from contaminated air respiratory infection.

③ In climate. In some area they suffer from more heat. they may have heat stroke as well.

→ biological environment

In this biological environment insects, Animals and bacteria are their ex: ① from mosquito we may suffer from the disease like dengue and malaria.

② from Dog bite we can cause the rabies.

③ Social factors

how we are interconnected with the people of the society and community and our religious, culture, food system.

ex: In some religions they don't eat some specific food. then they may suffer from few vitamins deficiency syndromes.

④ Behavioral factors.

→ lifestyle. → lifestyle is one of the main cause of having a disease. How we live and how we maintain diet, and about our habits and our work structure.

ex: * Alcoholism

* Smoking.

* No proper physical activity

* No having proper diet.

c) Health care services.

- availability of the hospitals.
- availability of the doctors
- affordable health checkups
- PHC services.

12) modes of disease transmission

Direct transmission

- Direct contact
- Droplet infection
- Contact to soil
- Skin to body.
-

Indirect transmission

- vehicular born disease
- vector born disease
- Air born disease
- uncleaned fingers.
- fomites

→ Direct transmission

It means when the person come with the direct contact with the people who has infected with a specific disease.

• Direct contact

when they direct contact with the infected person.

e.g. HIV, AIDS and any STD disease.

→ Droplet infection.

~~when some come close to~~
when the infected person sneezes and
by his cough the disease may spread through
his via droplet. Saliva.

ex:- Tuberculosis (TB), leprosy.

→ Contact with the soil

when we are having a open
wound in our body then come contact
with infected soil chance of having a disease
is more.

ex:- Tetanus.

→ Skin to body

when we feel any animal bite
to our ~~too~~ skin and the saliva or venom
of that animal enters in our body then chance
of having disease is more.

ex:- Dog bite (rabies) and snake bite.

Indirect transmission

when we are not come in ~~the~~ so the contact with the infected person but still by some vector cause disease as well.

→ Vehical born disease

chance of having the disease from vehical born like water, Air, Climate and many

ex:- by drinking of contaminated water may suffer from Cholera.

→ Vector born disease

The vector which carry the disease from environment to the host more human being. they may cause multiple disease

ex:- edis egypt mosquito it is also a vector it can cause the dengue and may suffer from malaria and other diseases as well.

→ Air born diseases

when the contaminated soil mixed up with the Air this may cause of having diseases

ex: - respiratory disease, and many more.

→ uncleaned hygienic

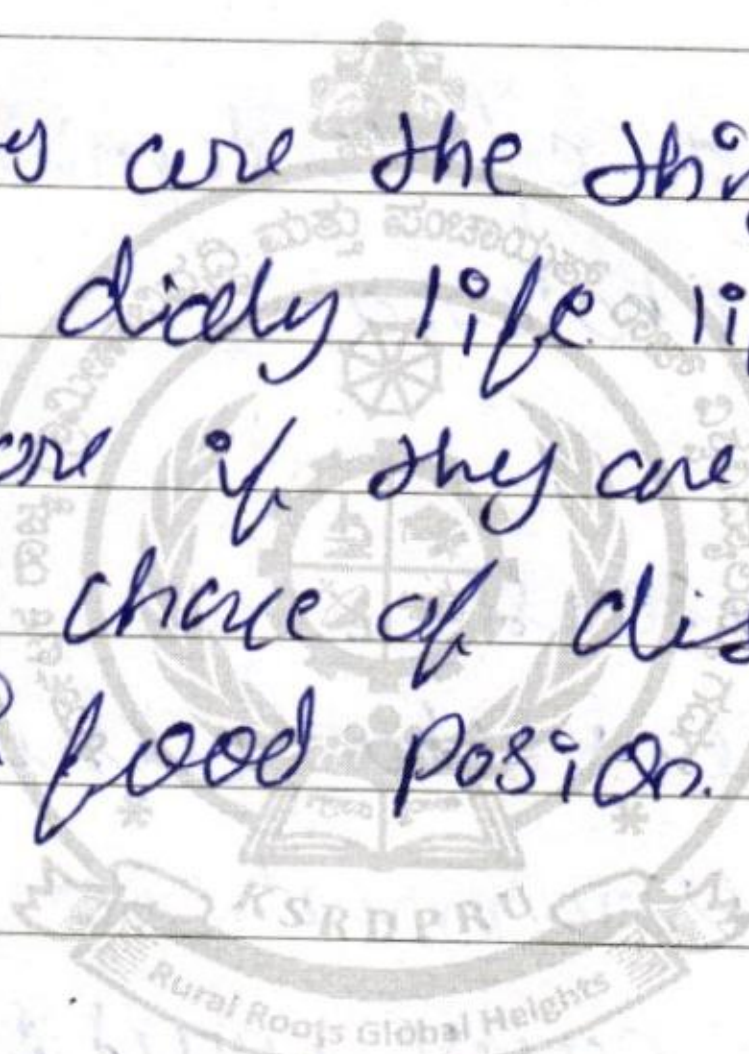

without washing hands if we intake the food then the bacterian can enters into our body.

ex: food poison.

→ fomites

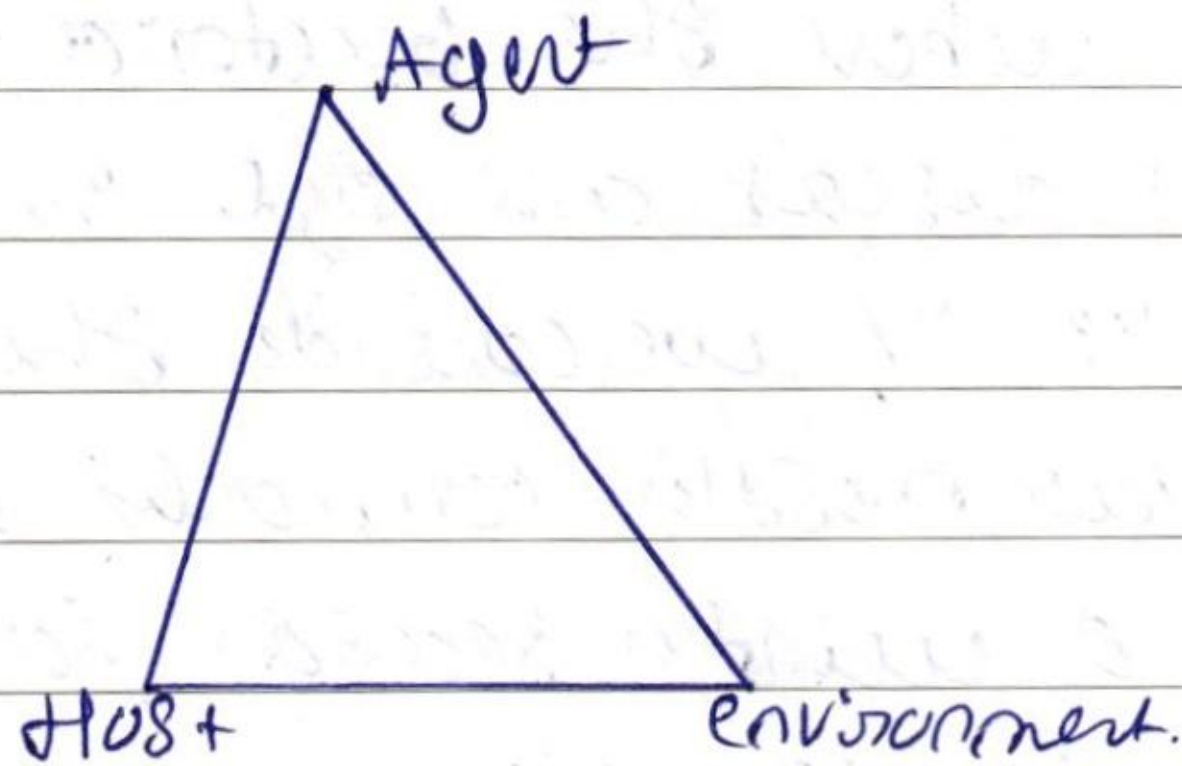

Fomites are the thing that we use in our daily life like Pen, book, table and many more if they are contaminated then having the chance of disease is more.

→ dust clerens & food poison.

PART - B

5] Epidemiological triad

It is the relationship between the Agent, Host and Environment.

→ Agent.

which carry the disease from environment to the host through the form of agent, vector.

ex:- Dengue. it is the communicable disease. In this disease, Aedes-egypti mosquito is the agent. it carry the disease.

→ Host.

Host more uses the disease survival and multiplies itself. called as host most commonly Human being.

→ Environment

when the bacteria takes birth like some disease are often in some specific seasons like if we consider the dengue it is disease mostly commonly occur in the rainy and winter season so some time climate also plays major role in the disease control.

ex:-

One example for the epidemiological trail how it works

Dengue - It is disease most commonly it occurs in the rainy season and winter season. So here environment is rainy season

→ environment - rainy season.

and the mosquito takes birth in a clean stored water when it not fully covered with any other they grow from egg, larva, pupa and adult

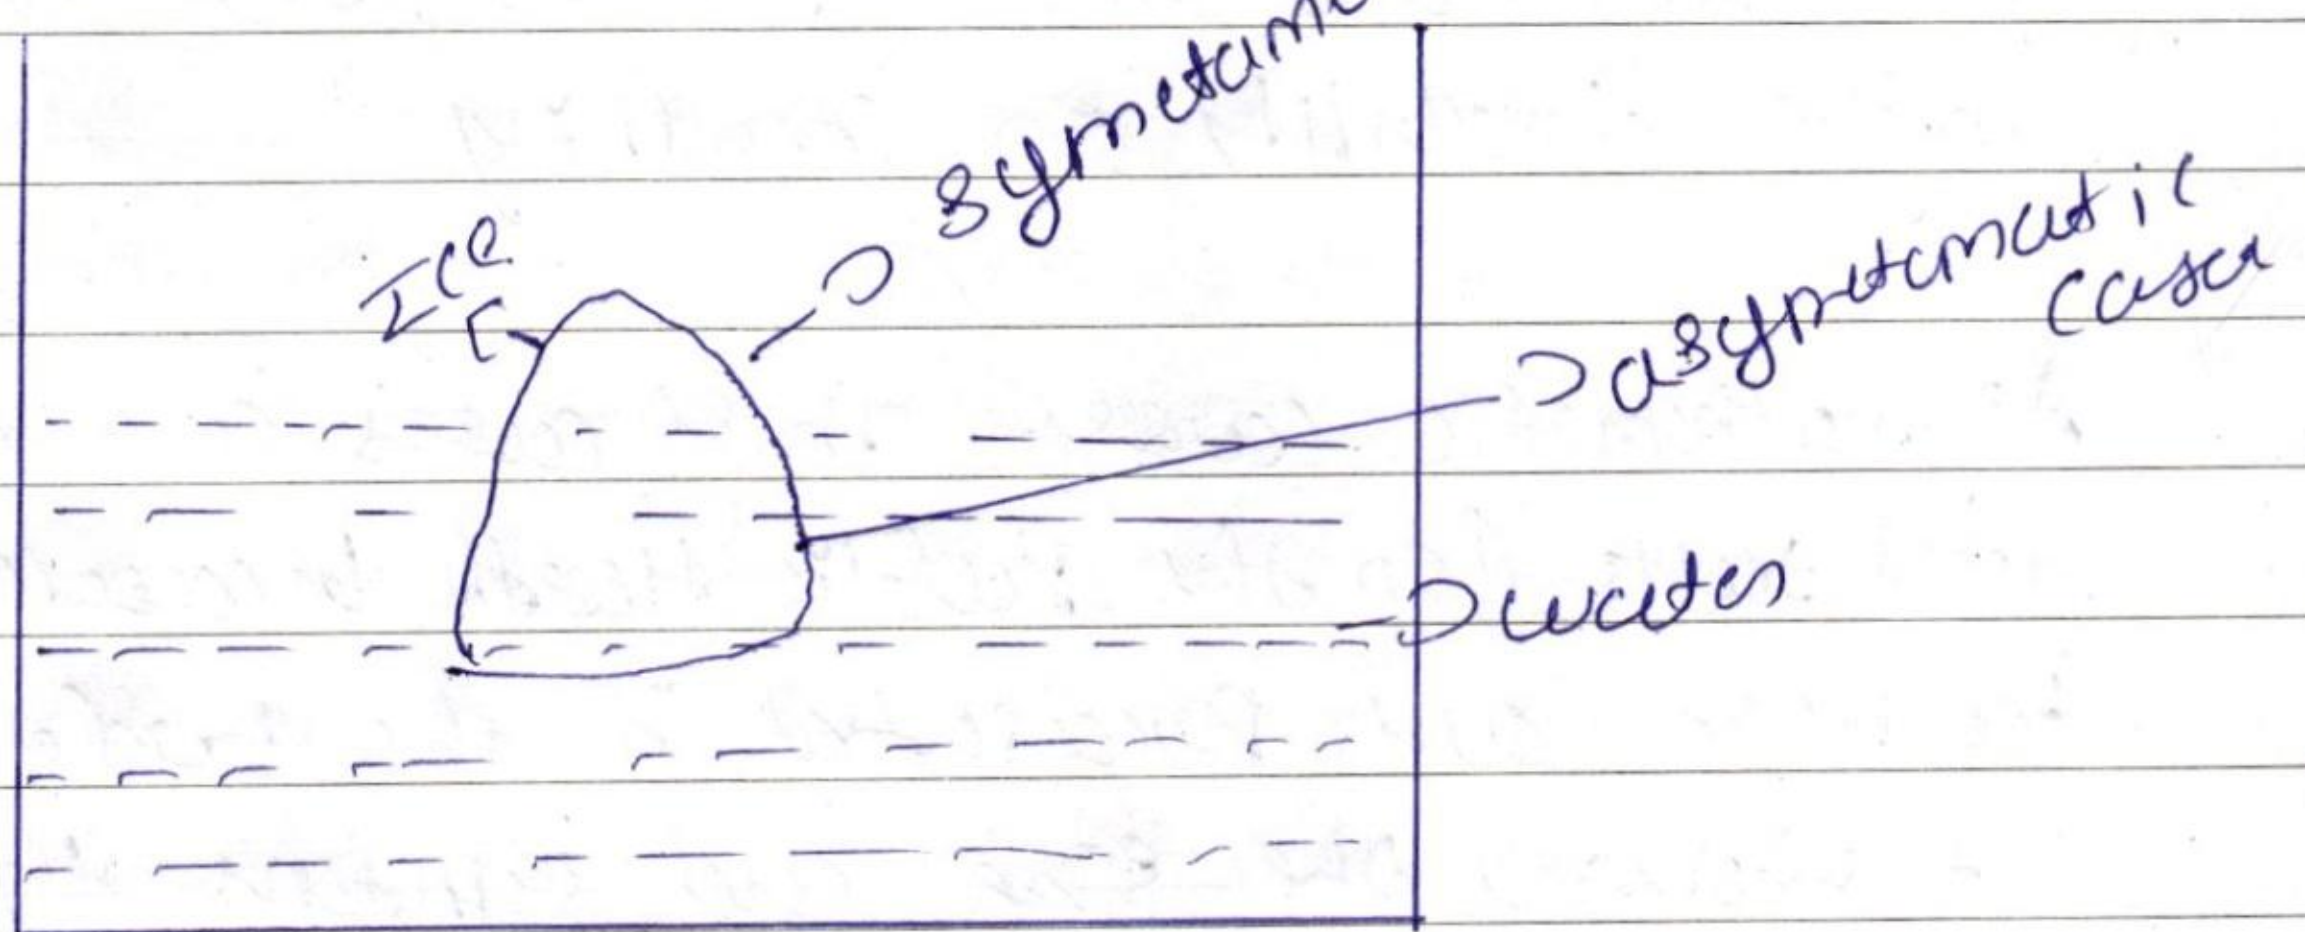

→ Agent is - edis - egypt - mosquito

and its majorly bite in day time in home at day time the age group was older persons and younger children.

→ Host - Human being (old age group and children).

③

Iceberg Phenomenon

Iceberg Phenomenon means study that in the community many people are suffering from different types of health diseases & know one knows who is suffering which diseases so the Iceberg phenomenon has that there is in the community, symptomatic diseases are also there and asymptomatic diseases are also there.

Symptomatic cases -

Symptomatic cases are easy to diagnose in the community because they are having a & any symptoms they come under for the hospital they takes the treatment and if it comes earlier then it was cases very good to cure of diseases

few people neglect the disease and symptoms as well and then it leads to the major disability on something.

Asymptomatic cases - These cases are the real task for the Public Health because the bacteria are presented in the body but not showing the sign and symptoms then it's very hard to find out for everyone even which person is having that he can't identify that disease so Asymptomatic diseases are very dangerous as well because ~~they~~ the infected person spread the disease from one to another and who come in contact with him as well. Very hard to find out make of household survey are nicely helpful and forcing them to take the treatment is also very important. and we need to convince them they take a treatment well they chance of cure is very high. Once we diagnose the disease then we control it well.

⑥ Characteristics of Health Indicators

- morbidity
- mortality
- Health Education
- Health Promotion
- disability
- developing Health Policy.
- endemic
- Pandemic
- epidemic

→ morbidity. - morbidity shows the ~~at~~ how much diseases are present in the community

→ mortality - no. of death in a year or major mortality means the death rate rising in the community

→ Health Education - Educating the people for making Health camps and script, shows ~~at~~ giving awareness about the diseases and providing information about Personal hygiene and breast feeding. and make them a good hygiene person teaching them to leave the bad habits

→ Health Promotion - Promoting Health ~~that~~ in the society and community ~~and~~ creating awareness about the Health care and implementing the national Health programs

→ disability - some people are suffering from major disability like in accident they lose their body parts. we need to provide service from the Public Health.

→ Health Policy -

Implementing the Health Policy. the national Health Policy like NRHM, NTEP (national TB eradication program) and it Health to develop the. our society

→ endemic

. The cases that occurs in the community

→ epidemic

The cases that ~~other~~ sudden increase in the community at the specific geographical area.

→ Pandemic

The diseases are spread from countries to countries

- ④ disease eradication and disease elimination
→ both are the process that helps to control the disease in large amount if.

a) disease eradication

The word eradication means that eliminate the ~~causes~~ disease causing bacteria completely from the whole environment and it is not the easy job as well. If in early time many peoples and village were suffered from the disease like Plague - Plague is the disease that can occur the whole village than they are were suffer from that disease on that they do not have any type of vaccine and treatment as well so now almost for every disease we have a vaccine when the covid was started in the India in starting days there was was no vaccine after few months our scientists find out the vaccine for that covid virus vaccine were covaxin and covishield. So eradication of a disease is a very tough job for health workers.

ex: - Plague this is eradicated now

6) Elimination of disease

Elimination of disease is like one. We eliminated the disease it may occur again as well. Because for example leprosy it is very old disease our health workers were trying to eradicate this disease from very long time by making the leprosy survey and opening the Rehabilitation centers for then providing proper treatment as well elimination make the disease eliminated in our community only but not in the environment. So lot of diseases are in the stage of elimination like TB, leprosy and many more TB diseases are also a old disease we diagnose the disease and provided treatment and give them DOT tablets as well and taking care so not spread more and taking all safety measures but still we can't eradicate the disease so for that Partial elimination is not the last stage of disease one clinical case of occurrence is also there.

ex:- TB (Tuberculosis), leprosy.

PART - C

(C) Disease Prevention.

majorly a few types in the disease prevention they are.

- ① Primordial Prevention
- ② Primary Prevention
- ③ Secondary Prevention
- ④ Tertiary Prevention.

Prevention means we control the disease before it occurring.

- ① Primordial Prevention - Primordial Prevention means mass approach to the society. it means providing health education about the specific disease and converting them to good attitude. Teaching them to know about the disease and causes of the disease. For example health problems. Few people were badly addicted to the alcoholism and smoking and few were in tobacco chewing so for them we need to provide the health education for them.

② Primary prevention

Primary prevention means if some one is doing a bad habits we know that he may suffer some disease in future we need to guide him right now so that is Primary prevention. In that we need to give some explanation then how badly that affects on your health & community. ~~that~~ we need to make them aware then about the disease. Tell them to stop doing that habits in village centers lot of ever used to chew tobacco in heavy amount they may suffer from cancer as well. So we need to tell them about it.

③ Secondary prevention

In Secondary when the ~~bad~~ disease causing bacteria already entered in the body and it may be symptomatic or non-symptomatic we need to make scan and make clinical tests and make the good treatment as well. ~~before~~ the steps which was doctors told to do and in this time we may

have a chance of ~~now~~ cure because if we
diagnose the disease early and start a
treatment early then chance of ~~being~~
curing is very diagnose and treatment is
very important. making of household survey
are most important. because we we find out
the suspect if he having some symptoms then
we need put him under the medical treatment
and give the suitable treatment and make
him cure.

④ Termination Privatisation

In this Privatisation. This is a
last stage of Privatisation. In the stage
if the patient was not quering now he
should want to be the health department
having the rehabilitation centers and
we may control him to not suffers with any
disability for example now ~~lethargy patient~~
~~having more~~ TB Patient was quering now
he wants to be then he should be sent
to the Rehabilitation center and they should
take care of him providing when their
nutritional food, and tablet and all needs
some what he wants
