⑥ The four main types of tissues in the human body are-

- * Muscle tissue
- * Connective tissue
- * Epithelial tissue
- * Smooth tissue

⑦ Functions of the Skin

⇒ There are 3 types of skin in human body.

- * Endemic
- * Epidermic
- * Hypodermic

Functions are-

- * The skin which protect from the U.V radiation
- * The inner skin which is attached to veins & muscles helps to flow blood easily
- * The skin is our layer has waterproof & protect by any small injury.

⑧ Difference b/w arteries & veins

* Arteries

⇒ arteries which can analysis the breaking sen

Sation in human body

* The arteries which connect to the nerves.

* Veins

→ The veins which helps to blood flow by the inner of veins to human body

→ The veins connect to whole body to supply blood to heart to body.

① The major organs of the urinary system are

* Kidney which helps to purify the water & transmit to urinary system.

Part-B

② The nephron which is the main part in the separation of respiratory system helps to the body to balancing the water & salt in the ^{urinary} ~~respiratory~~ system and make the ^{urinary} ~~respiratory~~ system make the easily body balance.

Functions

- ⇒ The nephron that works in the separating & cleaning the waste thing in ^{urinary} ~~respiratory~~ system & moving the easy flow of urine
- ⇒ The nephron possibly can detect the waste thing and it can stop them going to the stomach directly transfer to the ~~the~~ urine pass.
- ⇒ The nephron is the main part of the ~~respiratory~~ ^{urinary} system because it helps in every waste part which enters to the stomach.

Conclusion: Nephron is the main organ in the ^{urinary} ~~respiratory~~ system helps to separate the waste products & transfer them into the urinary pass.

⑥a) Respiratory System

The respiratory system which helps to keep body calm & make ~~urine pass easy~~ to ~~the respiratory system~~ breathing in proper wave.

* Functions of respiratory system.

- ⇒ The functions of respiratory system which help the break in the better.
- ⇒ Respiratory can take the main role in the breaking because it is main part of the human body
- ⇒ Respiratory can play Role in 2 types
 - ① In hale
 - ② Ex hale
- ⇒ When the inhale body is ~~noting for~~ ^{oxygen} ~~and~~ & when it is exhale it ~~have~~
- ⇒ Respiratory system work in every second of the breaking process.

④ Pituitary glands & thyroid gland.

thyroid gland

The thyroid gland which is present in the human body by the part of neck & it helps to swallow the food & water to the stomach & is the main thing in living organisms.

Function of thyroid gland

- ⇒ The thyroid gland which make the swallow the food to our intestine to get nutrition
- ⇒ The thyroid gland has some processing thing which can sense the food how it is hard or soft.
- ⇒ The thyroid gland can effect by more sugar food & it can harm by thyroid gland.

Function of Pituitary gland

- ⇒ The pituitary gland which absorb the food from thyroid gland and helps to transmute for the intestine.
- ⇒ The Pituitary gland can essent in the intestine upper layer.
- ⇒ The pituitary works in the form of the spreading the food & getting some amount of nutrition to body
- ⇒ The pituitary gland which support to the intestine & make the mixture to form the nutrition sassy.

(5A) The process of digestion & absorption of carbohydrates by the food.

~~Intro~~ Introduction The process of digestion of food in the step layer & it makes absorption in carbohydrates make some amount of nutrition.

* The process which makes absorption of carbohydrates when the food is in the mouth & make transport to the digestion system. It works in the form of cutting of food & making them into small parts & making pure. In pure food separate it can transform to the digestion & not create the carbohydrates. & keep body with the active & make ensure the body proper nutrition & carbohydrates and the body can be absorption in good active.

* When the body starts inhaling the food from the mouth it will stroke its first process in the mouth the

- The food have cutting in to many part & transfer to the pipe & it connect to diagestion system.

* Then the food which transfer to diagestion system it start more more carbohydrate & make more nutrition to keep body active to hole day.

+ The food what we consume that must be in a good nutrition becz when we consume the good nutrition food to our body the diagestion system more proper carbohydrate & supply in proper way to body.

* The carbohydrates are main source to the body becz body consist of nutrition & carbohydrates and many thing to keep the body active hole day.

Conclusion :- The process which make diagestion system to keep body support to the nutrition and carbohydrates can be active.

Part C

(8A) The levels of structural organisation in the human body are:

- * In the outer layer of the body structural organisation like the body looks for words, the both shoulder are edge of the body & the hands & arm looks down words to foot and the body has stable sitting.
- * In the inner layer of the body structural content like the inner there is a thyroid gland it transfer to the digestive system & small intestine, large intestine and kidney. Pituitary gland which support to urinary system and it help to digestion the food in the stomach which carry more time.
- * When the outer layer part works like the first the head which have ear, nose, eyes, tongue, make him active &

Constrate to the particular target.

- * When it comes to the hands it has a worker make the activities & doing work which the hand response.
- * When the brain give the worker to the body there is a only part which work from the outer layer. Hands, legs but they the main outer layer work soon as possible.
- * When the nerve give pass mess to the body to do work then the body automatic start worker which has mess given by the nerve.
- * In the inner body the body make more work & make the proper work to give the strong program to done to body.
- * When it comes to digestion the body want nutrition to make work but there is less nutrition body will be weak & can't make any work. So the digestion system

more active.

- * When it comes to urinary system it helps to pass urine in a easy manner and keep body balancing in day life and make body calm.
- * When it comes to kidney it work on the urine when the body drinks the water it transfer to the kidney & make filter of the water & it transfer good water to the body & bad water to the urinary system.
- * When it comes to respiratory system make the body breath easily and keep body in calm method where the respiratory system work by the process of inhalation & exhalation & keep body at calm.
- * When it comes to lungs are the most precious thing & sensitive thing in human body because lungs are so delicate when the oxygen enters to

the body & lungs can purify & oxygen and it can set the body clear. When we drink good water or juice the lungs are in good method but when we drink alcohol, cigarette the lungs are become weak & we can't get good breathing system to body.

(10A) the process of blood & coagulation & the mechanism blood circulation by the method which we make our daily activity.

Introduction :- The method how blood circulation body and it can transform by vein to every part of the body & the process of blood coagulation by the food & nutrition which convert into the blood. blood is a main source of the body when the blood can't flow in the correct way there may be more risk chance of the heart attack, paralysis, in the human body.

⇒ The process of blood is when the body is getting good nutrition & food then the blood will be increase & make body circulation.

* The food which we consume to the body then get disease and transfer to digestion & digest in good manner & transform into the blood by veins.

* When the blood process work from the nutrition it makes more thick new & smooth to flow in the human body and the blood coagulation in to every part of the body & make to active every hormones.

* The blood generates in the body by the presence of the activity of body and the food which the body consumed. If it is a good nutrition food or lack of nutrition food.

* Then when it comes to mechanism of blood circulation there is a several methods it come to start from heart.

* The heart will be have 4 chambers then the blood will transmit by arteries then the heart make the blood clean in every chamber & it transform every body part with pure blood supply.

* When heart pumps the blood in every second the blood flow is continuously moving to every part & more active and strong.

* When the ~~sex~~ circulation of blood is continuously moving then heart will be pumping blood in pure form and getting good blood transmission to the body when the blood flow through veins & arteries the every veins get clean & the body will in the stable condition.

* The blood circulation are first getting the good nutrition food to body and it break down to the mouth and transfer to the digestion system then it will move to the nutrition by the process & the every steps the blood will flow through the veins & send to heart & heart make pure & the blood in 4 chambers & it transmore again through blood veins.

Conclusion 2 The blood coagulation & the mechanism & blood circulation is the very important role becz when the body is getting correct supply & blood it goes to work in the proper method and keep the body in correct manner but when the mechanism & blood circulation will stop than the body has chances to get ~~Attack~~ heart attack, paralise & the part which didn't get proper blood circulation so. proper blood circulation is getting by the proper nutrition.

(12A) The role of water & pH in maintaining homeostasis in the human body is main imp thing.

Introduction : When the water level & pH level is equal in the body there is a good conduction of body work when it is not in balance method then it can be something harmful to body.

* When the water & pH maintaining in good method body didn't get dehydration & it well been in cool method didn't get any sign & symptom to the body.

* When the water & pH maintaining level is not balance the body will get a lack of problem & it may cause the sign & symptom of disease which can cause to worse thing to body.

+ We should always make the water & pH level in the correct way the process when the body get good water & proper

Source of water than the pH level will be equal to the water so then they both can be in normal contact.

* But when the body is not getting sufficient water than the pH level will be more and it can't be balance in the body temperature.

* pH levels is maintained by the water homeostasis of body where it can be get pure by the urinary system which the best & good water can be converted to pH level than the body can maintain in normal condition.

* So we should make pH & water level in the normal by some method like urinary method or we kidney works to purify the method which consist of water by supplying to urine bladder.

* The water consist of body level should be fast of water coz the body wants more water than food to make pH levels equal to the body and it maintain in equal form.

* When the water & pH levels is maintaining in correct form then the salt of the urine blade getting out of the body & then the pH & water will be correct & flow through easily method by the consist of fast of water in the human body.

* It can be consider to the body and the body temperature is gets in normal temperature when pH & water is in maintaining level. So when the body temperature is not is normal level then we should know that water level is less than pH level in the our body. So. In that time we should consume the required more to balance & maintain pH level & water level in equal method.

Conclusion: The process of maintaining a water & pH in homeostasis in the human body is good but in the water & pH level there is any one less & they are not in perfect way then the body will get some symptoms and didn't get proper response so we should maintain the water & pH level in homeostasis by the method which is connected to the lot of drinking water & pure nutrition to the body then pH & water level is in maintaining form of human body.

Part - II

①.

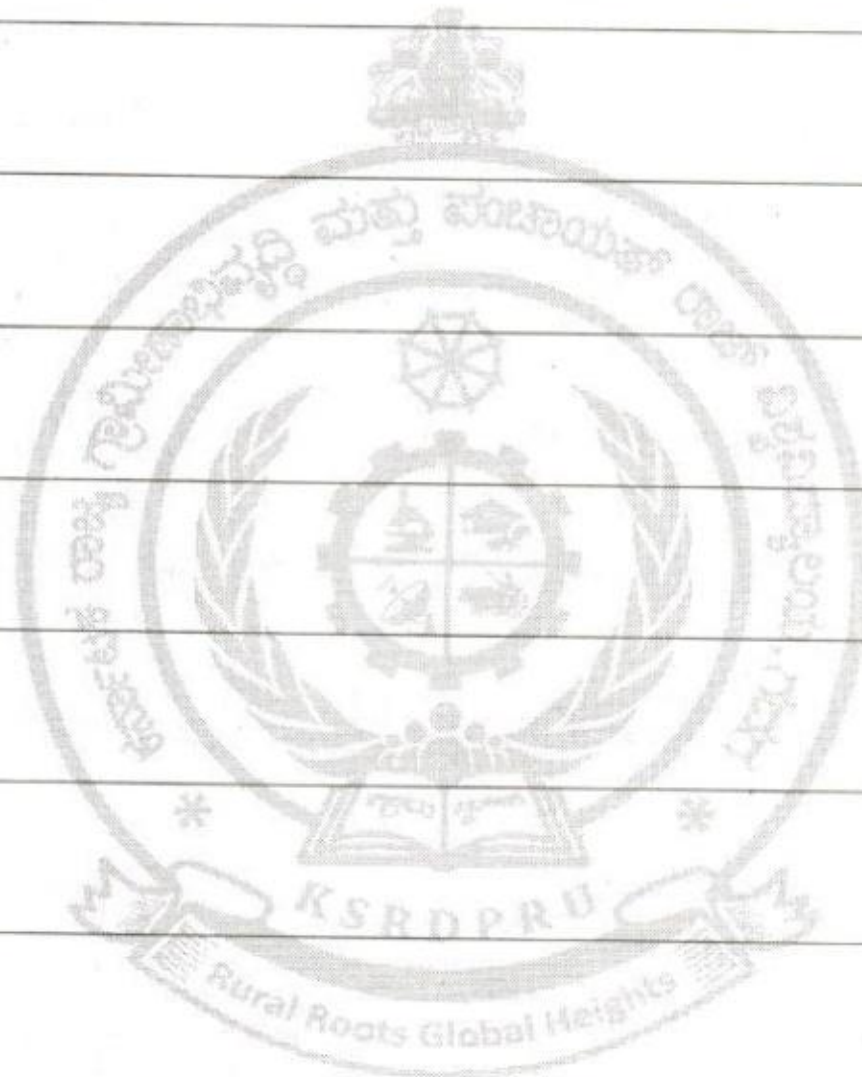

②. Neuron is a main content of the body which can connect to million or neuron to the body gives mess to brain.

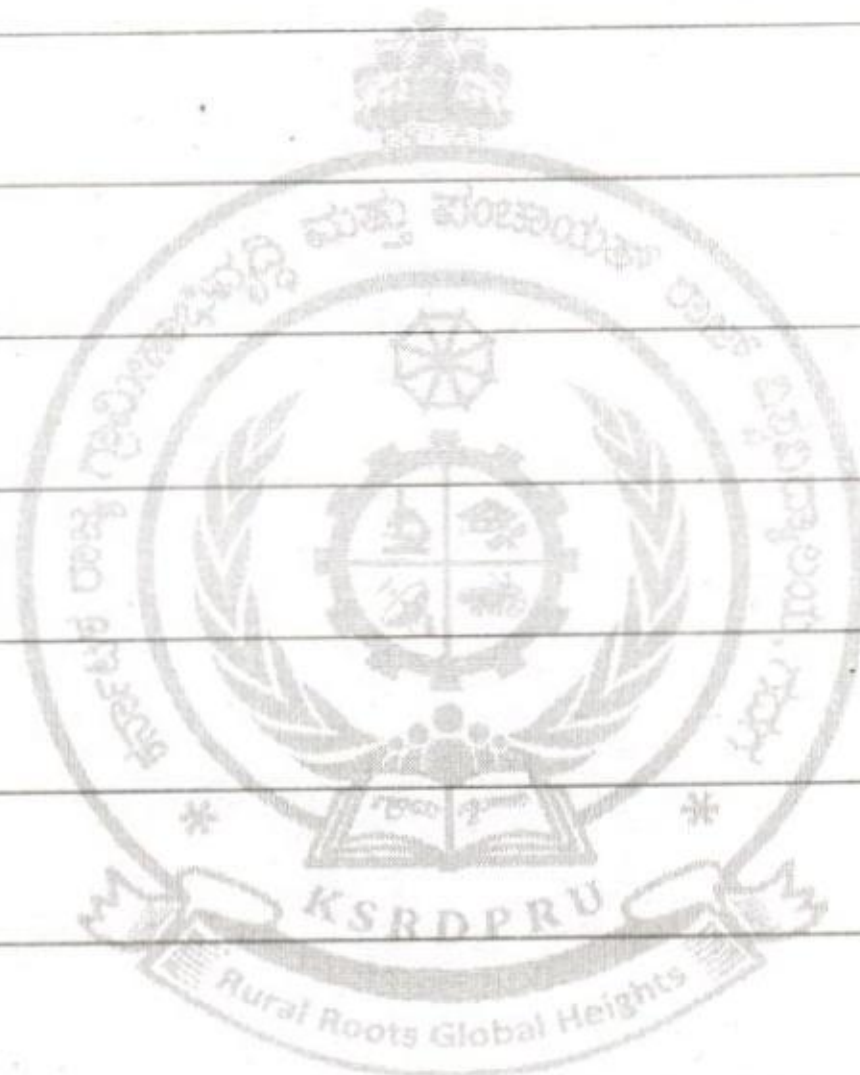

Function of neuron

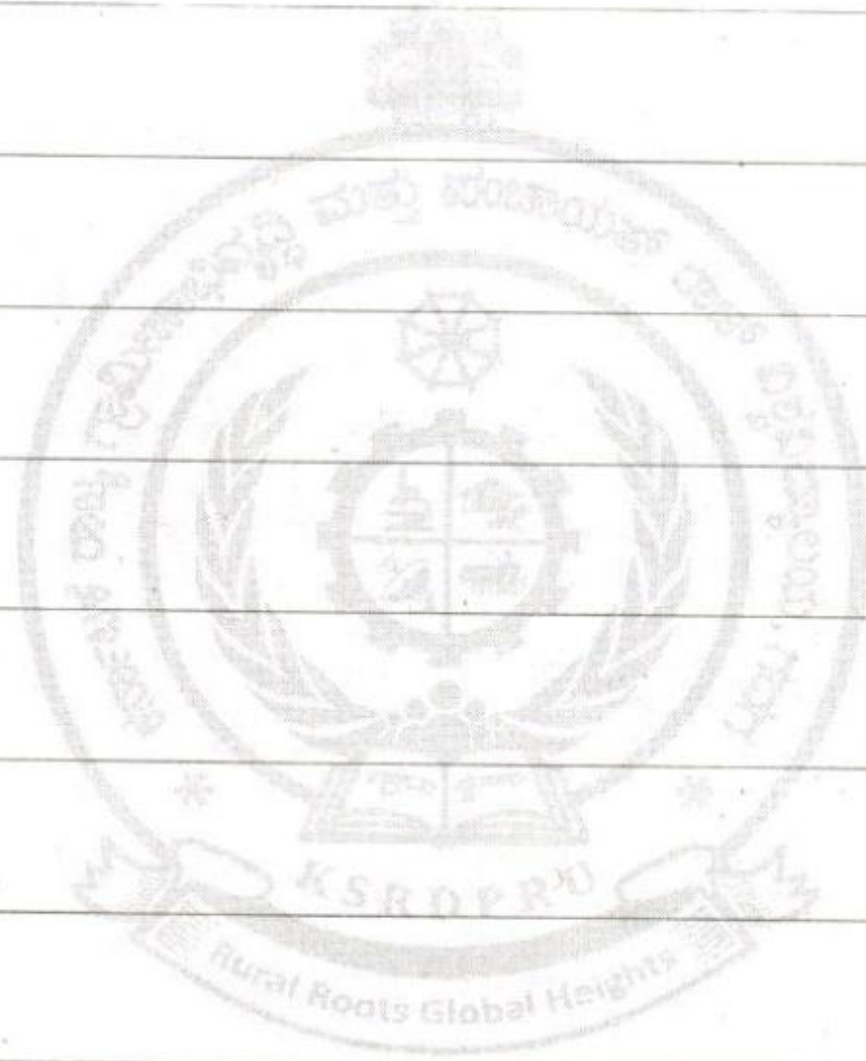

* It transmits the mess to brain & give proper mess to the body

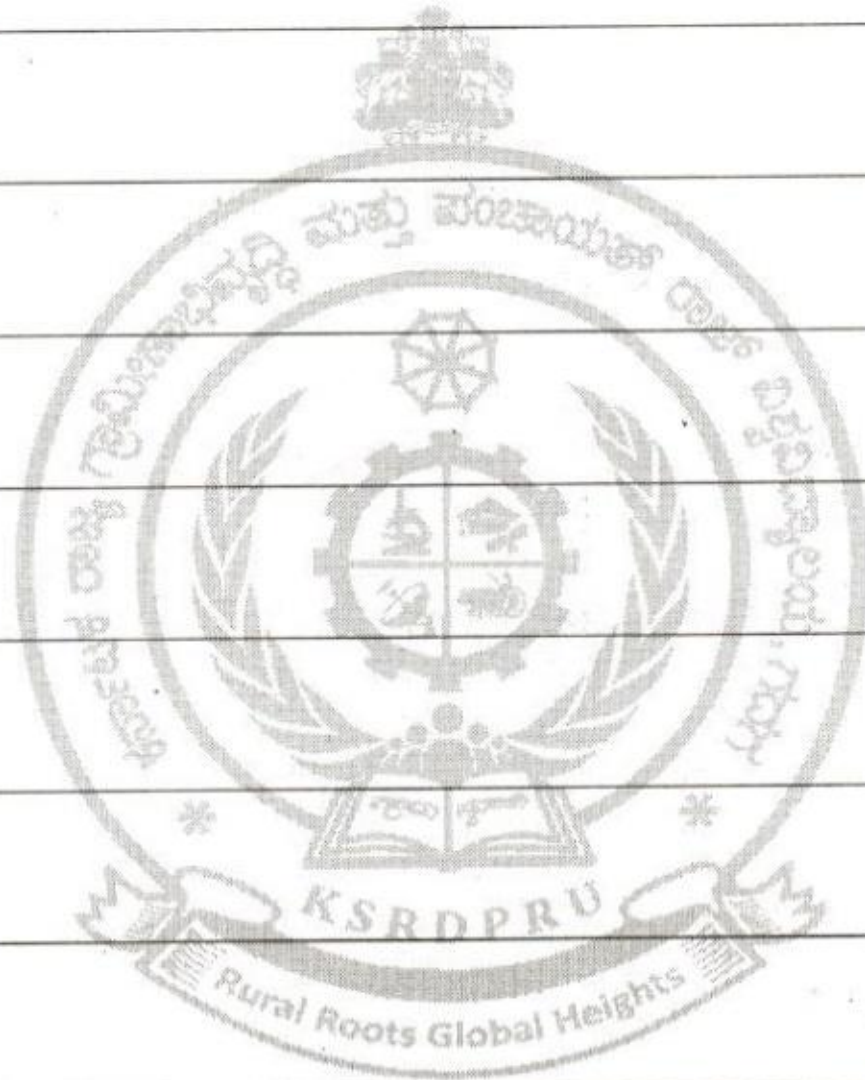

* It transmit proper mess & send proper mess to brain.
