PART - A.

1 a) epidemiology is the study of distribution and determinants of the health related events on specific population and study of control of diseases. Prevent outbreaks and prevent diseases before occurring in the community.

f) Incidence -

It helps to measure the new cases occurring in the community prevalence -

It helps to measure the old and new cases occur in the community.

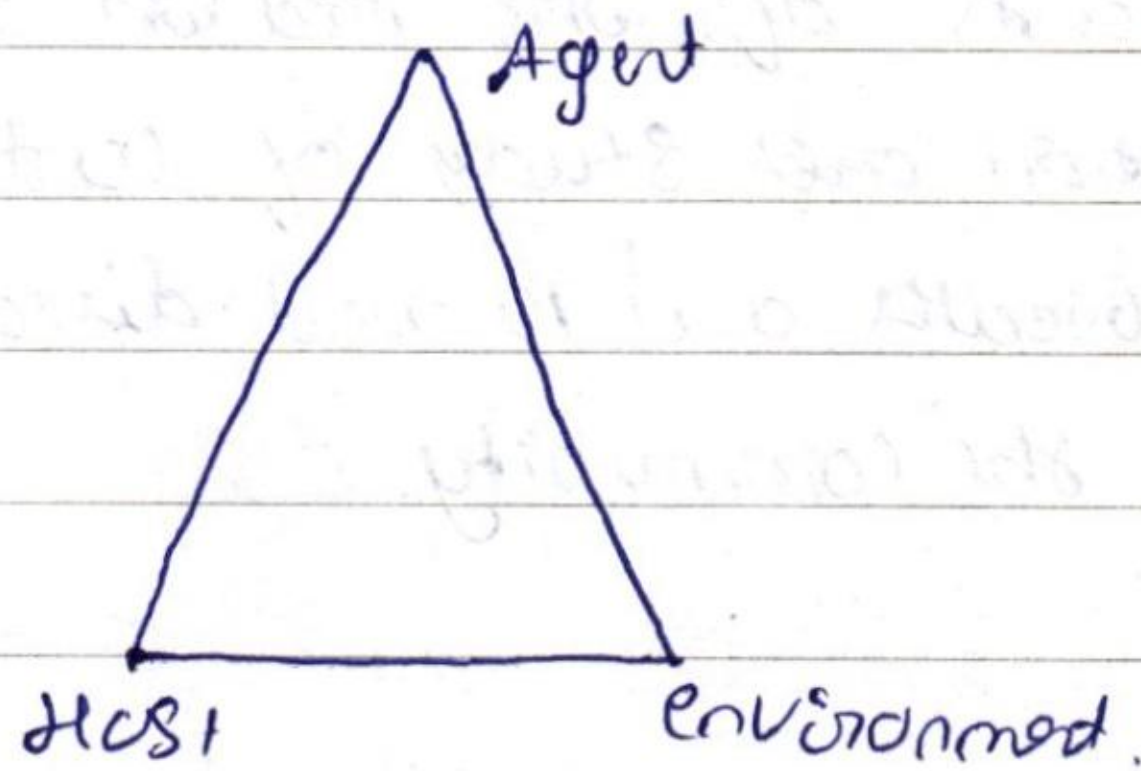

g) endemic - endemic means the disease present in that geographical area. Commonly, that is called endemic

* epidemic - The sudden increase in the number of new cases - in the community (outbreaks) that is called epidemic

* Pandemic - The disease which spread globally from one country to another. that type of disease called pandemic ex:- covid-19.

PART - B.

2) Epidemiological triangle

The relationship between Agent, Host and environment is called as Epidemiological triangle.

→ Agent

Agent means which carry the disease one to another that is called as agent.

* Biological agent - viruses, bacteria, fungi

* Nutritional agent - vitamins, fats, lipids.

* Physical agent - disability.

* Mechanical agent - exposure to the external environment

→ Host

In which The virus, or bacteria, leaves and multiplies themselves called as host. basically in all better most of time human being is the host.

→ Environment.

Environment include the ~~at~~ surrounding climate for specific disease are spread more in rainy seasons ex: malaria, dengue so environment plays major role.

* Biological environment - water, air, sound.

* Physical environment - winds, insects

* Social environment - surroundings

→ Example - Dengue

Dengue is communicable which spread through the mosquito called Edis-egypt-mosquito and it most commonly spread in the rainy seasons. It takes ⁱⁿ cleaned stored water and it most commonly bites in day time so the main target age group was old age people.

and kids we need to destroy the breeding places of the dengue mosquito and take preventive measures like wearing full sleeve clothes, using mosquito nets, and by fogging these are few preventive measures of the dengue mosquito.

→ Agent - Culex - Egypt mosquito

→ Host - Human being.

→ Environment - rainy and winter seasons.

3) Mortality.

Mortality helps to measure the death rate of the population in a specified given period of time.

- Death rate
- crude death rate
- specific death rate
- Infant mortality rate (IMR)
- mother mortality rate (MMR)

ex:- ~~Death rate~~. In a city of 1,00,000 people 800 people died in 1 year.

$$= \frac{\text{No of death in 1 year}}{\text{mid year Population}} \times 1000$$

$$= \frac{800}{1,00,000} \times 1000$$

$$= 8 \%$$

8 People died Per thousand. Population in one year on that City.

→ Death rates

measures the death of the Population in a specified period of time.

→ Specific death.

Specific death rates People lost their lives for any specific cause, specific disease or specific death.

ex:-

$$\frac{\text{No of People died by the malaria}}{\text{mid year Population}} \times 1000$$

→ Crude death rate

Crude death rate mean. People who died for any cause that death rates comes in the crude death rates.

→ Infant mortality rate [IMR]

Helps to measure the death rate of the infants

$$\frac{\text{No of infant death in a year}}{\text{mid year population}} \times 1000$$

→ Mother mortality rate [MMR]

Helps to measure the death of the mother (ANC/PNC) Patients

$$\frac{\text{No of mother death in a year}}{\text{mid year population}} \times 1000$$

→ Importance in Public Health

- This all helps to comparing the old and new data
- Helps to serve in the community. It indicates the Health Status and
- Our work in the community
- Helps to comparing.

4) Determinants of Health.

The factors that influence to the Health. Biological, environment, social factors

- Biological factor
- environment factor.
- social factor.
- Health care service factor.

Biological factors.

- Genetics - Genetics plays the major role in the Determinants of Health because some some chronic Diseases like, Diabetes, Hypertension that spread through the genetic.
ex:- if our father or mother any one in the family is suffering from Diabetes, Hypertension then there is chance of having disease to his son.

→ Age.

Age specific diseases are some orthopedic diseases that old age people are suffer lot because they lose their mobility power

when they are at old age they may suffer from that disease.

→ ex:- if a pregnant lady's age was above 30 it is considered as high risk pregnancy and the old age suffer from orthopedic problems.

→ Environmental factors.

* Biological factors - The disease spread from air, water, sound and climate.

ex:- water - contaminated water causes cholera.

Air - Contaminated air can cause some respiratory disease.

Climate - Heavy temperature cause Heat Stroke.

* Physical environments - The disease spread through the animals and insect.

ex:- Dog bite can cause the rabies and Aedes aegypti mosquito can cause the dengue, and Anopheles mosquito can cause the malarial disease.

→ Social ~~factor~~ ^{factor}.

Religion - In some religions some forced on not suppose to eat they may suffer from vitamin deficiency.

→ Health care service.

- Availability of the hospitals
- Availability of the doctors
- Availability of the Ambulance facility
- Affordable treatment.
- Availability of the any PHC, CHC nearby the place we are leaving.
- good road facility.
- Immunization.
- Health workers.

This all factors influence our health and these are called the determinants of health.

PART - C.

q) Health indicators.

Some major health indicators are

- mortality
- ~~morbidity~~ morbidity.
- nutritional status
- Policy development.
- control of disease
- Health education

→ mortality.

mortality helps to measure the deaths among the population in a given period of time.

→ morbidity.

morbidity helps to measure the which diseases are active in the community today at the present time. ~~it shows~~ it shows the status of the.

→ nutritional status.

nutritional status plays major role in health because lot of people suffer from malnutrition. so nutritional is very needed. Specifically for old age, pregnant women, and for young one. Some people were very poor they can't afford nutritional food. So government provide nutritional food for them ex:- at anganwadis pregnant women's get the nutritional food.

→ Policy development.

Policy development and policy implementing in the community both are major role because some policy are already there at the community level. So we need to implement them in a good way at the community. Implementing the national health programs like malaria elimination program, Tuberculosis eradication program and many more disease specific program and providing Immunization for all of the beneficiary. and help to make development of new policy.

① Control of disease

disease controlling measures preventing the disease before occurring in the community. ~~So~~ that the Health workers need to work hard. they need to make those surveys for people:- to prevent vectors born diseases like dengue and malaria they need to control this disease. ~~mean~~ they should do the Home Survey then it comes in the control stage.

① Health education.

Increasing awareness among the people of the community by providing the Health education. to the ~~all~~ ~~and~~ ~~measures~~ then aware about the diseases like communicable and non communicable and providing Health education about the Personal Hygiene and. Some people are badly addicted to the habits like Tobacco Chewing and Smoking we need provide the awareness about the causes and effects of the diseases so that they can stop their bad habits and be a good person in the society.

29878

→ IMR

Infant mortality rate, Infants death are happens more when the mother was ~~anemic~~ anemic and she was not receiving the good nutritional food ~~so~~ if she was not having then she both mother and child consider the risk now in India the IMR rate is in the control belows Health workers identify the anemic mother birth and takes the special care about her and make her good at her level.

→ MMR.

mother mortality rate. Death of mother in the stage ANC and PNC antenatal care or Post natal care now. MMR is also in control in India the ~~the~~ ~~death~~ registrations of the pregnancy at PHC they check the height and weight of that lady if she was short lady or a thin lady then she should be considered as the High risk pregnancy so they take care and provide iron folic acid tablets for her to develop her Health Status.

11)

Investigation of epidemic (outbreaks)

Epidemic means the sudden increased cases of the in the community more than normal in a short period. That is called as a epidemic and also called as a outbreaks

when health workers get to know the outbreak is happens they rushed into that places and find the:

• **Cause** - Find out the cause for the outbreaks. Some disease are spread from the contaminated water, Air so they check the water and many

• **Diagnose** - They diagnose what kind of disease that spreading in the community by observing the sign and symptoms. If it was the sign and symptoms of cholera and then they should check the water whether the pipeline are ok it was not spread by the mixing of the contamination.

29878

^(Travel history)
 History - If that community was involved in any function below five days they may having contaminated food then and so that they all are facing the problems.

Control - They try to control the spread of that particular by some preventive measures like quarantining the persons, if it was water born the stops that contaminated water stands using the purified water. They supply the good water for the community if it was by food persons providing ORS to the people of the community like that.

Treatment - Provide the treatment if it was severe then they refer them to PHC or district hospitals. From there they get know & check specific diseases is spreading in the community and the people gets the proper treatment for those diseases if it was not serious then they treat him in the local by providing ORC and some First Aid treatment.

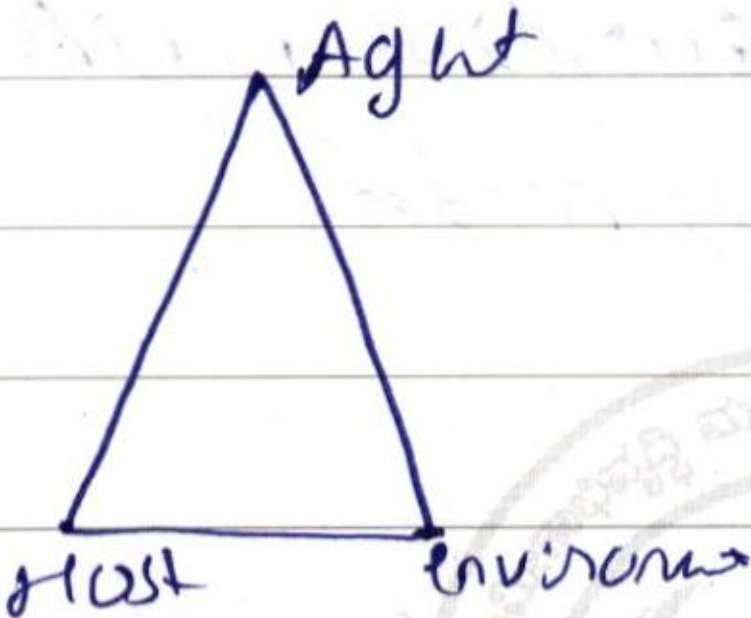

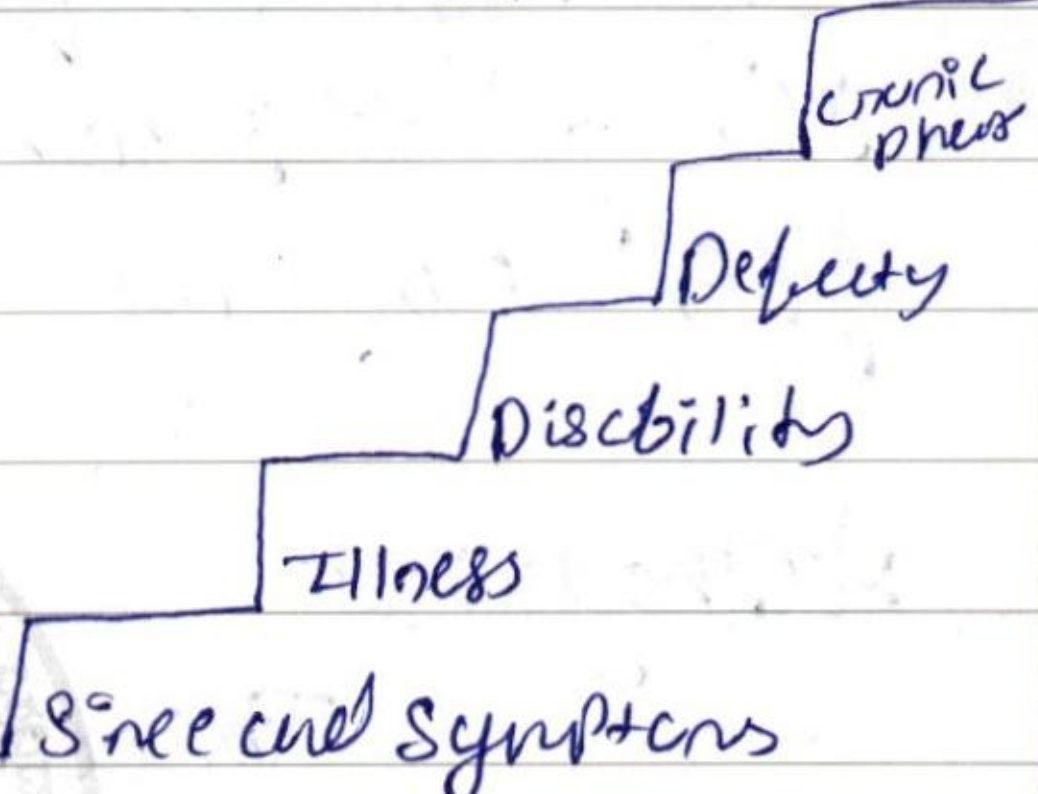

29878

example for outbreaks of diseases
→ cholera - cholera is a water born disease it spread through the contaminated water. If people in the community drink the contaminated water then they may suffer from the disease by some where the water pipe was broken & no one knew that was broken the harmful pathogens were mixed up with the water people in the community drink that water then they suffer from the disease and cholera disease it was outbreak how many people drink that water they are are having the disease? then the health workers went to the place and find out the cause of the disease they correct the pipe line and supply the good water to the community people who suffer from the disease they get treatment at the district hospital and take care of them properly.

29878

⑫ Natural history & levels of prevention.

→ Pre Pathogenesis & Pathogenesis

Pre Pathogenesis before men involve  Bringing Agent Host together.	Pathogenesis after men involve 
Primary Prevention Prevention before occur.	Secondary Prevention Specific Protection Tertiary Prevention Rehabilitation Disability

Pre Pathogenesis

Pre Pathogenesis means before men involve in that process occur the disease causing agent, Host, and environment with the Agent and Host bring together then this is called as having the disease we call all the same stage the same

29878

Environment changes leads to health diseases & fracture lifestyle. Our behaviour & some accidents may occurs and chance of changing of our life so enormous when the right environment we entered then the having a chance of the disease is very high. So for that purpose maintaining the good health and surviving with good environment is very needed.

Pathogenesis

When the men involve in that process when agent, host and environment was mix up together and it starts with the starts showing the signs and symptoms and when we not showed awareness we didn't take any treatment for them then we are in the risk then we feel illness and state of illness is Disability and after that we may suffer from the defect and all all of this the chronic phase once it was entered in chronic phase then chance of recovery is very low & next stage is Death only.

29878

Levels of Prevention

- Premedical Prevention
- Primary Prevention
- Secondary prevention
- Tertiary prevention

- Premedical Prevention - More like the cases in which factors are not present but we just make awareness about that particular disease and creating awareness upon the people of the community.
- Primary prevention - Providing the Health education if they were addicted to some bad habits like smoking and drinking we need tell what it leads in future and what may be having these.
- Secondary prevention - Providing specific treatment among that disease following the treatment measures given by the doctors and seeing if the tablets work and taking specific precautions against that disease.

29878

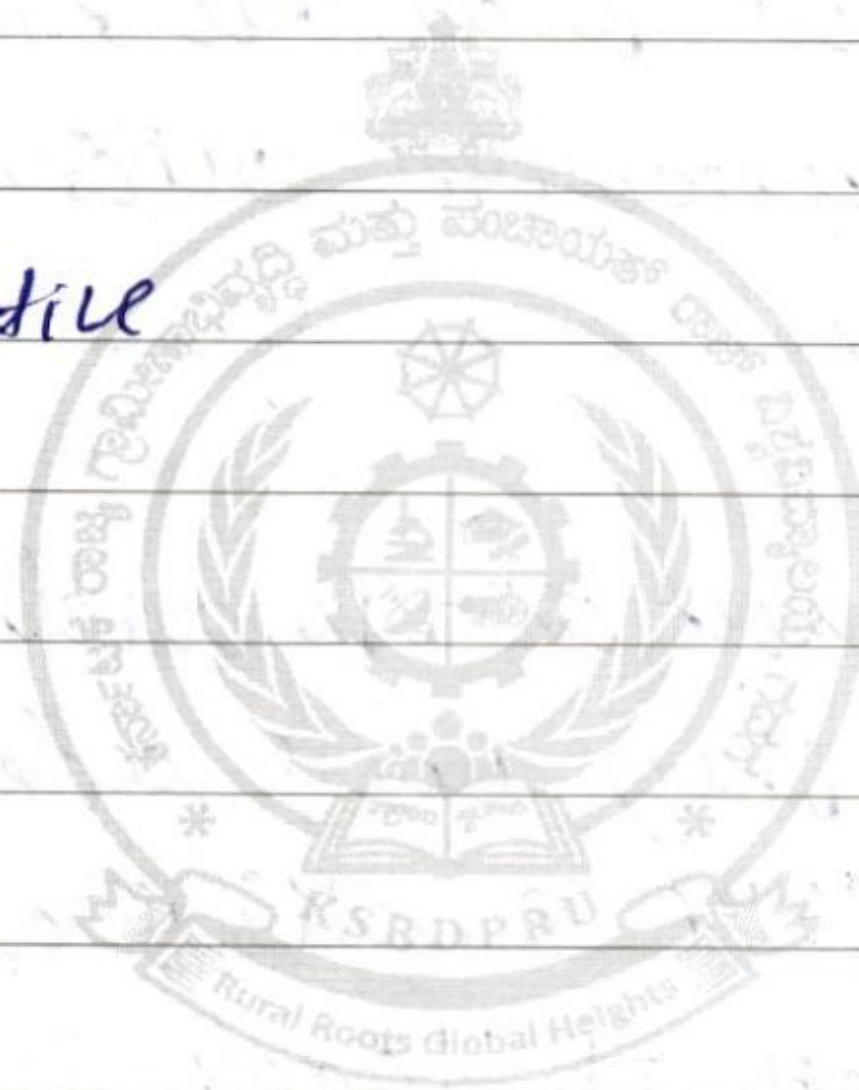

• Tertiary Prevention

It is the final preparation referring them to the nurses & Rehabilitation and taking care at Rehabilitation and having the limitation at disability

PART - A

c) Disability indicators

- life style
- bad habits
- Physical inactivity
- Obesity.
- Junk food
- accidents.

d)

- age
- sex
- lifestyle
- environment
- Obesity.

or

→ In despite old age and young one are at risk factor because it bites in the morning

B

PART - B

6) Immunity

Immunity which is present in our body and helps in fighting against the harmful pathogenic agents like bacteria, viruses, fungi.

Immunity has two main types.

• Active Immunity.

Active immunity means it was present in our body by birth or it starts increasing as we increase this by taking nutritional food for our immunity. For example, antibodies in the human body. The WBC which is also present in the human body and helps to fight against the pathogens which enter in the human body and it helps to maintain good health in our body.

So for the immunity is very needed to the human being. As when we get old we start losing our immunity by day by day. On that time we can't do any work how used to do at the young age and we get to face a

29878

orthopedic problems and memory loss
 lot of problems was face due to not
 having group immunity so immunity is
 needed very much

A Addition Immunity

We receive the additional immunity
 by the vaccinations, DPTs and by infections
 so that is called having a immunity
 by another source and another way.
 so immunity is needed at every stage
 a few years back one vaccination came
 from thing that is covid-19 the
 corona virus that spreads through the
 Air, germs, that disease mainly came
 for old and young who are having
 a less immunity then our scientist
 produce the vaccine for that vaccines
 called covaxine, covishield. and provide
 supplements to the patient who was
 suffered from covid. and for preventive
 purpose who was not suffer from
 the disease for then also they provide
 treatment so treatment for the immunity
 is very necessary otherwise we may suffer
 lot
